<sup>3</sup> Surfing Western Australia

## Abstract

Surfing is a cultural ecosystem service providing recreational benefits to over 50 million people worldwide and contributing to market economies through retail and tourism expenditures. Australia is globally renowned as a premier surf destination, with more surfing ranking as the second-most practiced water based sports among the Australian population. This study presents the first assessment, at the national level, of the impact of surfing on Australia's economy and participants' wellbeing. Using an online survey, yielding 569 valid responses, our results show that average surf-driven domestic expenditure on equipment and travel is A\$3,370 per person per year. Aggregating across a population of 678,000 Australian adult surfers, we calculate direct input into the market economy to be A\$2.56 billion per year, whilst the overall impact is estimated at A\$4.6 billion per year, after applying relevant retail and tourism multipliers. Our survey results also reveal that over 75% of sampled surfers reported better or much better outcomes in terms of their mental and physical health, as well as ability to form and foster social relationships. Survey participants also reported high levels of concern regarding coastal erosion, climate change and overcrowding. Despite limitations of the non-probabilistic sampling approach, as the first national results on the impact of surfing in Australia, we expect this study will help fill an important information gap in the economic assessment of coastal recreation. Our study fits into a broader body of work aimed at assessing economic activities associated with the oceans (i.e. blue economy), in order to inform decision-making processed towards greater coastal sustainability and resilience.

**Keywords:** surfing economics; coastal management, blue economy, outdoor recreation,

---

## 1. Introduction

In Australia, as in many other countries bordering the ocean or sea, coasts are important assets providing numerous services, including recreation for local residents, as well as domestic and foreign visitors (Rolfe & Gregg, 2012). The economic value of recreational beach visitation across Australian beaches is well researched (e.g. Pascoe, 2019; Prayaga, 2017; Rolfe & Dyack, 2011; Zhang et al., 2015), including for specific activities. In particular, a large body of literature exists on the estimation of recreational fishing values in Australia (Pascoe et al., 2014; Prayaga et al., 2010; Raguragavan et al., 2013; Scheufele & Pascoe, 2022; Yamazaki et al., 2013), while other have examined the values of diving (Carr & Mendelsohn, 2003; Huveneers et al., 2017; Stoeckl et al., 2010) and snorkeling (Kragt et al., 2009). Despite international recognition of surfing as cultural ecosystem service (Román et al., 2022), very few studies have examined economic values associated with recreational surfing in Australia.

42 Since Lazarow (Lazarow, 2009; 2007, 2008) first documented the direct contribution of  
43 surfing to the economy of the Gold Coast, in the state of Queensland, there have been  
44 practically no peer-reviewed studies on the economic value of surfing. A notable exception  
45 is Pascoe (2019), who estimated consumer surplus associated with surf trips, as part of a  
46 travel cost estimation of multi-purpose visitation to New South Wales beaches. Two reports  
47 commissioned by local councils have estimated the contributions of the surf industry to the  
48 local economy within the Victorian Surf Coast Shire (AECGroup, 2014) and the City of Gold  
49 Coast (City of Gold Coast, 2020).

50 The lack of scholarship regarding the value of recreational surfing is at odds with its high  
51 level of participation, with surfing being the second-most practiced water based sport, only  
52 after swimming (AusPlay, 2023). There are more Australians (15+ years) practicing surfing  
53 (705,800) than recreational fishing (360,200), sailing (194,400), scuba diving (55,800) and  
54 snorkeling (53,800) combined (AusPlay, 2022). Further, surfing is among the top five in-  
55 nature physical activities (after walking, swimming, running and cycling) and the fastest  
56 growing within this group (see Table A1 in the Appendix for participation figures across  
57 sports and physical activities). Between 2016 and 2022, the Australian surfing population  
58 grew by 37%, partially accelerated by newcomers during COVID-19 lockdowns and border  
59 closures.

60 Worldwide, there are an estimate 50 million surfers, with its popularity rising since the start  
61 of the pandemic and surfing's inclusion as an Olympic sport in 2021 (Mach & Ponting, 2021).  
62 Growing demands face the challenge of limited supply, given that surf breaks (and the waves  
63 they generate) are a finite resource, which in many cases are subject to growing risks  
64 (Orchard et al., 2023). In addition to user overcrowding and tourist pressures common to  
65 beach environments (e.g. congestion, littering) (Chen & Teng, 2016; Mach & Ponting, 2018),  
66 surfing ecosystems – i.e. surf breaks and their surrounding environments (Manero, 2023) –  
67 are exposed to changes from climatic events (e.g. storms, erosion) and coastal developments  
68 (e.g. seawalls, marine infrastructure). Evidence from across the world points at the growing  
69 impacts on surfing ecosystems, as the effects of coastal changes on wave formation are still  
70 poorly understood and rarely quantified or mitigated (Bryan et al., 2019; Corne, 2009;  
71 Jackson et al., 2007; Leon, 2012; Scarfe et al., 2009). There is thus a need among coastal  
72 planner and policymakers to sustainably manage coastal spaces to cater for diverse  
73 recreational user groups, including surfers (Olive, 2016).

74 To raise awareness of the importance and fragility of surfing ecosystems, over the last few  
75 decades, community organizations, such as Surfrider Foundation ([www.surfrider.org.au](http://www.surfrider.org.au)) and  
76 Surfers Against Sewage ([www.sas.org.uk](http://www.sas.org.uk)), have played a fundamental role in knowledge  
77 generation and translation, including for policy change (Touron-Gardic & Failler, 2022). For  
78 example, in 2020 in Chile, advocacy efforts by Fundación Rompietes and Save The Waves  
79 Coalition led to the creation of the Created Piedra del Viento Coastal Marine Sanctuary – a  
80 4,000 hectares biodiverse hotspot, home to two iconic surf breaks (Save the Waves, 2020a).

81 More recently, a growing body of academic literature is demonstrating the multiple values  
82 associated with recreational surfing, and the need to protect them from rising threats. From a  
83 health and well-being perspective, surfing has been examined as part of 'blue spaces', i.e.,

84 health-enabling places where water is at the center of the environment (Britton et al., 2020;  
85 Olive & Wheaton, 2020). The therapeutically benefits of surfing are now well documented  
86 among adult and children participants with special conditions, such as post-traumatic stress  
87 disorder (Caddick et al., 2015; Marshall et al., 2021), poor mental health (Marshall et al.,  
88 2023; McKenzie et al., 2021; Olive et al., 2023), disabilities (Armitano et al., 2015) and  
89 chronic illness (Government of Western Australia, 2023). While surfing is an individual  
90 sport, it has been shown to contribute to multiple aspects of social wellbeing, including  
91 community cohesion and strong family relationships (Lazarow & Olive, 2017; Pearson,  
92 1979; Suendermann, 2015; Wheaton et al., 2021). Further, surfing's sense of place has been  
93 observed as a catalyzer of pro-environmental attitudes, like care for coastal landscapes, ocean  
94 literacy and activism (Booth, 2020; Fox et al., 2021; Lazarow, 2010; Román et al., 2022). In  
95 fact, surf breaks are often located within or nearby areas of high ecological significance, thus  
96 co-hosting cultural and environmental values simultaneously (Reineman et al., 2021;  
97 Touron-Gardic & Failler, 2022).

98 Beyond surfers and direct surroundings, the presence of surfing ecosystems has observed  
99 effects on local and regional communities, for example, through revitalizing and enhancing  
100 regional economies; attracting and fixating local employment, and promoting improvement  
101 of local services and infrastructure (Machado et al., 2018; McGregor & Wills, 2017;  
102 Reineman, 2016). Economic analyses have estimated various forms of values, benefits and  
103 impacts of recreational surfing (see Table A2 in the Appendix for a comprehensive overview  
104 of market and non-market valuation of surfing). For example, using night lights as proxy  
105 indicator, McGregor and Wills (2017) found that, at a global scale, good quality surf breaks  
106 add \$4.00 billion in economic activity, when effects within 10km radius are considered,  
107 compared to poor quality breaks. A hedonic pricing study by Scorse et al. (2015) found  
108 location right next to the Santa Cruz (California) would increase a house price by US\$106,000,  
109 compared to an equivalent property one mile (1.6 km) further away. While a few other non-  
110 market valuation studies exists (e.g. Pascoe, 2019; Ramos et al., 2019), the literature on  
111 surfing economic values focuses on direct expenditure (see Table A2).

112 Prior to the COVID-19 pandemic, global expenditure in surf tourism was calculated at  
113 between US\$31.5 and US\$64.9 billion per year (Mach & Ponting, 2021). Local studies, often  
114 commissioned by non-for-profit organization Save the Waves coalition, have estimated  
115 economic impacts of surf tourism in popular destinations, such as such as in Uluwatu,  
116 Indonesia (Margules et al., 2014) and Guarda do Embaú, Brazil. (Bosquetti & de Souza,  
117 2019). In Australia, the contribution of surfing to the Gold Coast was first estimated by  
118 Lazarow (2009) at A\$126-233m/yr (in 2007 prices). Based on an unpublished 2019 report,  
119 the City of Gold Coast indicates the contribution of surfing to the local economy is \$542  
120 million, equivalent to 1.5% of the area's Gross Regional Product (City of Gold Coast, 2020).  
121 Within the Surf Coast Shire (Victoria), the surf industry is estimated to contribute A\$217  
122 million, directly and indirectly, through mechanism, like equipment manufacturing and sales,  
123 and provision of hospitality services (AECGroup, 2014). No other studies could be found  
124 regarding the economic value or impact of surfing in Australia.

125 Mirroring an international pattern (Mach, 2021), the lack of recognition of surfing values in  
126 Australia is both a cause and effect of surfing's absence from crucial considerations around  
127 the "blue economy" and "ocean sustainability". For example, Australia's State of the  
128 Environment Report addresses concerns linked to coastal visitation for fishing, snorkeling  
129 and scuba diving – but not surfing (DCCEEW, 2021). Unlike countries like New Zealand  
130 and Peru, where surf breaks are recognized by national-level legislation (Orchard, 2020;  
131 Orchard et al., 2023; Scheske et al., 2019), Australia's environmental laws and policies largely  
132 overlook surf breaks (and surfing ecosystems) as valuable natural assets. Australia is home  
133 to over 1,230 documented surf breaks, but only 20 have some form of legal protection, under  
134 the NSW *Crown Lands Act 1989* and Victoria's *Heritage Act 2017*. Other forms of  
135 recognition exist, like the Gold Coast surf management plan (City of Gold Coast, 2015) and  
136 World Surfing Reserves (Save the Waves, 2020b), although these lack legal weight. In  
137 absence of an understanding of the value of surfing ecosystems and formal protection  
138 mechanics, coastal planners and developers risk making decisions causing irreversible  
139 damage. For instance, the expansion of the Ocean Reef Marina in Perth (Western Australia)  
140 caused the disappearance of three surf breaks in 2022 (Manero, 2023). Despite initial  
141 dismissal due to cost concerns, petitions from local community groups for the construction  
142 of an artificial surfing reef were endorsed for further consideration by the local council in  
143 June 2023.

144 This study aims to assess the impact of recreational surfing on Australia's market economy  
145 and participants' wellbeing. As growing coastal hazards compromise the processes needed  
146 for wave formation, coastal planners are required to prioritize strategies to safeguard  
147 ecosystem functions that sustain local socio-economic and environmental benefits. We  
148 expect the results of this study to help fill the current knowledge gap in Australia's  
149 understanding of benefits derived from coastal recreation. The remainder of the paper is  
150 structured as follows. The *Methods* section describes the survey design, data collection and  
151 analysis processes. The *Results* present a summary of key finding in relation to surf-driven  
152 expenditure and perceived impact on participants' wellbeing. The *Discussion* brings our  
153 results into context with the broader literature and provides insights into the implications of  
154 our findings. The *Conclusion* offers some final remarks and suggestions for future research.

## 155 2. Methods

### 156 2.1. Data collection

157 Data were collected through an online survey administered between February 27 and May  
158 31, 2023. Data collection and storage were carried out in accordance with the Australian  
159 National University Ethics protocol 2022/822. The survey consisted of three sections. The  
160 first section included questions in relation to respondents' surfing habits (such as expenditure  
161 and travel). Other questions regarded surfers' concerns in relation to surf amenity and the  
162 perceived impact of surfing on their lives. The second part of the questionnaire consisted of  
163 an interactive mapping exercise, where respondents could select the surf breaks they had  
164 visited, and the frequency, over the 12 months prior to completing the survey. The third and  
165 final section included socio-demographic questions that describe surfers' profiles. See survey

166 instrument in Appendix. For the purpose of this study, surfers are defined as individuals who  
167 ride a wave with their bodies and/or a surf craft that is not motorized (Lazarow, 2009).

168 Responses were collected through snowball sampling (Johnson, 2014), which is  
169 recommended when targeting “hard to reach” groups or population sub-samples that typically  
170 under-represented in opt-in online are too small to be accurately represented in standard  
171 panels (Sadler et al., 2010; Zhang et al., 2020). As an incentive, survey participants were  
172 given the option (upon survey completion) to enter a random draw offering: one wetsuit  
173 valued at A\$900, one surfboard valued at A\$1,000) and two A\$250 cash vouchers. The  
174 survey was made available on the Australian National University’s Qualtrics (2023) platform  
175 and the link shared through a number of platforms, including large surfing organizations  
176 (Surfrider Foundation, Surfing Western Australia and Surfing Mums), radio and written  
177 media (Manero & Yusoff, 2023; Rivalland, 2023) and authors’ networks.

178 A limitation of snowball sampling is that, being non-probabilistic, it is subject to self-  
179 selection bias (Johnson, 2014), thus attracting responses from highly committed sport  
180 participants—a common feature of recreation demand research (Mackenbach et al., 2018).  
181 To assess the representativeness of our sample, we checked the characteristics of the surfing  
182 population against those reported by The Australian Sports Commission, which are the most  
183 comprehensive and representative figures of participation in sports and physical activities  
184 across Australia (AusPlay, 2022).

185 The survey returned 1,050 responses, but only 569 (54%) were retained after the clean-up  
186 process. This was mainly due to the high incidence of bot-generated responses, which has  
187 become a serious and widespread threat to the integrity of data from online surveys (Roman  
188 et al., 2022; Zarouali et al., 2023; Zhang et al., 2022). Following recent guidelines, several  
189 preventative steps were taken to mitigate bot incidence (Goodrich et al., 2023; Griffin et al.,  
190 2022), including avoidance of social media advertising and raffle-based incentives (not for  
191 single completion). Invalid entries were identified through a combination of: duplicate IP  
192 address, geolocation location outside of Australia, completion time, and duplicate and/or  
193 unusual responses to open-ended questions (Goodrich et al., 2023; Griffin et al., 2022). A  
194 summary of the clean-up protocol is presented in Table X in the Appendix

## 195 2.2. *Data analysis*

196 Following the processes undertaken in nation-wide study of surf expenditure in the UK (Mills  
197 & Cummins, 2015) and the most recent available estimates in Australia (Gold Coast)  
198 (Lazarow, 2009), data on surf-related expenditure was used to estimate surf-driven input into  
199 the national economy. As per Lovell et al. (2020), respondents were asked to report on  
200 expenses paid by them for others, but exclude expenses paid by other for them. Domestic  
201 travel-related expenses were solicited based on travel involving at least one night away from  
202 home. Only expenses for the last trip were recorded, as it is often difficult for participants to  
203 recall travel information over long periods of time (Heagney et al., 2019). To extrapolate  
204 over the whole year, we calculate the average overnight costs (based on last trip) and make  
205 the conservative assumption that all previous trips consisted of only one night away from  
206 home. To calculate the total input into Australia’s economy we exclude purchases of second-

207 hand boards. We aggregate based on a population of 680,500 adult (18+) surfers in Australia  
208 (AusPlay, 2022). We apply retail (1.77) and tourism (1.84) multipliers to account for the  
209 increase in intermediate inputs in the economy (indirect contribution) resulting from  
210 increased consumption of goods and services in other parts of the economy (Tourism  
211 Research Australia, 2023).

212 Our estimates are based on transactions that take place within established markets, which  
213 are closely aligned with the United Nations' System of Environmental-Economic Accounting  
214 (SEEA) stipulation for the use of exchange values (Pelletier et al., 2021). A limitation of our  
215 estimates is that they do not account for the full ecosystem service value, as other forms of  
216 value are excluded, such as consumer surplus and mental health (Buckley et al., 2019;  
217 Parsons, 2017). While expenditure is only a partial measure, it provides a useful indicator of  
218 the economic importance of surfing, in a way that makes it comparable to figures from  
219 previous Australian and international studies (Lazarow, 2009). Further, we do not estimate  
220 surf-derived environmental costs, such as those associated with the production of non-  
221 recyclable waste (wetsuits and surfboards) and carbon emissions from regular and holiday  
222 travel (Gibson & Warren, 2017; Manero & Mach, 2023).

### 223 3. Results

#### 224 3.1. *Characterization of survey respondents*

225 Most survey participants were male (57%), although the proportion as lower compared to  
226 national statistics. A comparison of survey participants against Australian Sports  
227 Commission surfers data, and characteristics of the Australian general population are  
228 presented in Table 1. Characteristics of our survey respondents can be explored through the  
229 interactive Power Bi data portal available in the Appendix.

230 Most respondents rated as intermediate (40%) or competent (26%), while fewer considered  
231 themselves as beginners (11%) or advanced/pro (2%). The most frequently used surf craft  
232 were shortboards (53%), followed by longboard (33%). Surfing is a regular activity, practiced  
233 on average twice a week.

234 Table 1 Socio-demographic characteristics of respondents

235 Data sources: Australian surfers (AusPlay, 2023); Australian population Gender (Australian Bureau of Statistics, 2022c),  
 236 Income (Australian Bureau of Statistics, 2022b), Education (Australian Bureau of Statistics, 2022a) (reported for population  
 237 aged 15-74 years); Location (Australian Bureau of Statistics, 2022c); <sup>a</sup> In Australia, TAFE (Technical and Further Education) is  
 238 a government-run education system providing vocational and skill-based training, post high school. Notes: 1. Ausplay data  
 239 report all university degrees together. 2. Ausplay data used the six following income brackets (AUD), which do not correspond  
 240 directly to the ABS and this survey: <40k; 40k-69k, 70k-99k, 100k-149, 150k-199k, 200k+. figures for these brackets are reported  
 241 in order from lowest to highest. 3. Location for survey data is broken down by: Regional = MM area 2-7. City = MM area 1. 4.  
 242 MM= Modified Monash categories.

### 243 3.2. Surf-driven contribution to Australia's market economy

244 Survey respondents reported spending, on average \$8.30 on regular items such as food, drinks  
 245 or parking, each time they visit their regular surf spots. Accounting for the reported surf  
 246 frequency, the estimated annual expenditure per surfer per annum on regular items is \$697.

247 Purchases of surf gear and surf-related services (e.g. repairs, coaching) averaged \$1,575 –  
 248 with new surfboards accounting for the largest proportion (40%). Most of these expenses  
 249 occurred within the domestic economy, with 93% of respondents reporting spending 75%–  
 250 100% of their surf-related expenses (gear and services) within Australia. Excluding second-  
 251 hand boards and accounting only for domestic expenses, the average surfer spends \$1,172 in  
 252 Australia every year on gear and other surf-related purchases.

253 *Table 2 Annual domestic surf-related expenditure across the whole sample (n=569) in A\$*

Category	Mean	Median	Std. dev	Min	Max
Regular items on visits to local surf breaks	697	195	1,266	0	8,450
Second-hand surfboards	193	0	500	0	6,000
New surf-related gear and services, excl. travel	1,381	890	1,840	0	21,100
New surf-related gear and services, excl. travel, spent in Australia	1,172	744	1,578	0	18,463

254 Over the 12 months prior to survey completion, 81% of respondents (n=461) took at least  
 255 one domestic trip. Among those who travelled, the mean number of trips was 4.8, with an  
 256 average of 7.22 nights away. The distance for domestic trips, calculated as a straight line  
 257 between postcode and destination, was 1,173 km on average, with a mean of 238 km. Twenty-  
 258 two respondents covered a distance greater than 12,400km. In their last trip, 84% of  
 259 respondents were accompanied by at least one other adult, and 40% reported travelling with  
 260 children. Total expenses for the last trip (including paid for by the respondent for others, but  
 261 not incurred by others for the respondent) averaged \$1,480, with accommodation (\$616) and  
 262 travel (\$382) being the largest components. Annual expenses on domestic surf trips were  
 263 calculated based on the number of annual trips, and the average expenses for the last trip  
 264 (Bergstrom et al., 1990; Lovell et al., 2020). No information was available on the length of  
 265 previous overnight domestic trips. Therefore, a minimum of one night was assumed, with a  
 266 cost equal to the average overnight spend (mean=A\$277). Among those who took at least  
 267 one domestic trip, the average annual travel expenses were A\$2,347. Including zero expenses  
 268 for those who did not travel (n=108), the average travel expenditure across the whole sample  
 269 (n=569) was A\$1,901.

270 *Table 3 Characteristics of domestic surf-related travel*

Category	Mean	Median	Std.dev	Min	Max
Respondents taking at least one domestic trip (n=461)					
Last domestic trip expenses (A\$)	1,480	900	1,856	0	13,700
Last domestic trip number of nights away	7.23	3	15.96	1	240
Last domestic trip expenses per night (\$A/night)	277	210	233	0	1,633
Number of domestic trips per year	4.79	3	5.66	1	50
Yearly domestic trip expenses, excluding last trip (\$A)	867	417	1,394	0	11,900
Total domestic travel yearly expenses (\$A)	2,347	1,480	2,606	0	21,741
Whole sample (n=569)					
Total domestic travel yearly expenses (\$A)	1,901	1,100	2,520	0	21,741

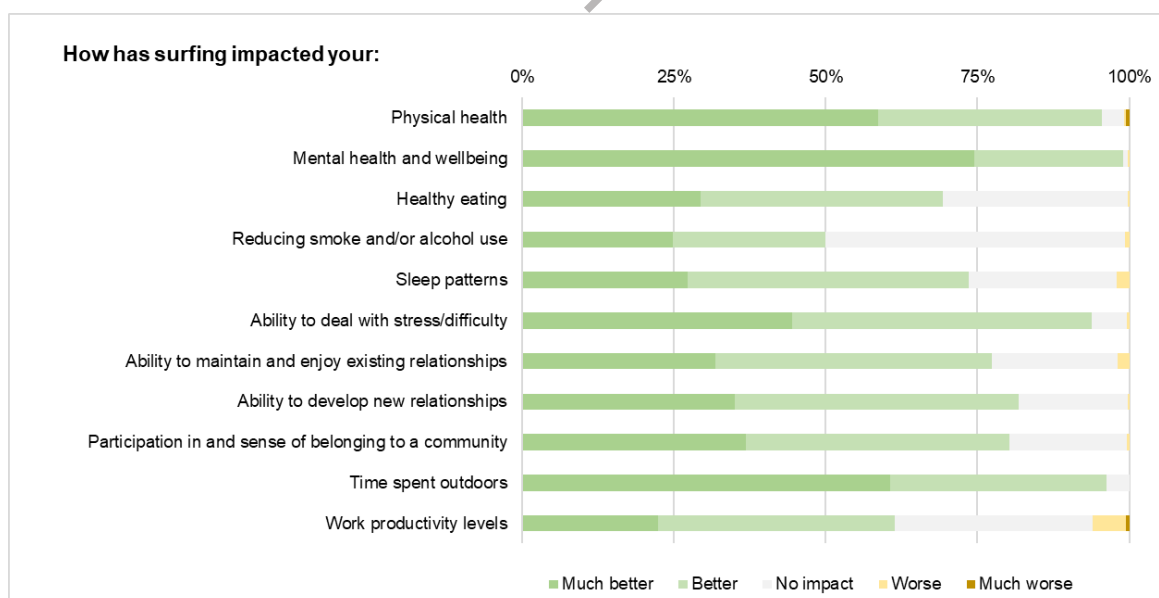

271 Across the whole sample, the average surf-related expenditure per annum, in Australia, is  
 272 \$A3,770. This includes regular items (A\$697), new gear and services (A\$1,172) and  
 273 domestic travel (A\$1,901). Aggregating across 678,800 adult (18+) surfing participants  
 274 across Australia (AusPlay, 2023), the direct input into the market economy is estimated at  
 275 A\$2.56 billion per year. Accounting for indirect impacts through retail and tourism  
 276 multipliers, the estimated input into the Australian economy from surf-drive expenditure is  
 277 A\$6,806 per person per annum, totalling \$A4.62 billion across the adult surfing population.

### 278 3.3. Self-reported impact on wellbeing

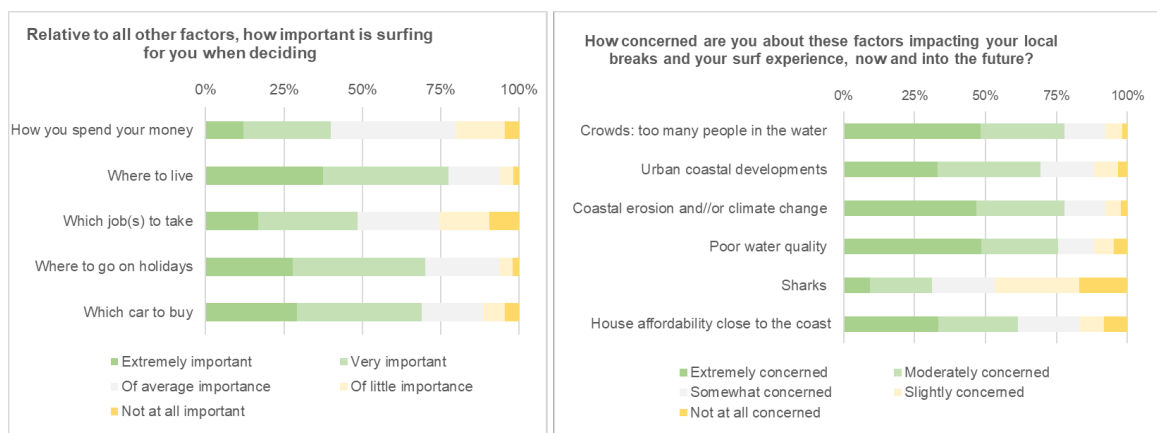

279 Across all 11 measures of perceived surfing's impact, over 50% of respondents reported a  
 280 positive change, i.e. "better" or "much better" (Figure 1). The highest proportion of positive  
 281 impacts were reported for physical health (95%), mental health (99%), ability to deal with  
 282 stress/difficulty (94%) and time spent outdoors (96%).

283 Survey responses also highlight the impact of surfing on 'participation and sense of belonging  
 284 to a community' and "ability to maintaining and enjoy exiting relationships", with 80% and  
 285 82% of respondents, respectively, reporting "better" or "much better" outcomes.

286 Across age groups and gender there was very little variation across most forms of impact (see  
 287 interactive data visualization in Appendix). A ten-point difference was observed in  
 288 the sense of belonging to a community and ability to develop new relationships questions,  
 289 where 88% of females reported positive impacts, compared to 74% and 78% respectively for  
 290 males.

292 *Figure 1 Self-reported impacts of surfing on participants lives*

294

295 *Figure 2. Importance of surfing in personal decisions (left) and concerns associated with surf sites (right)*

296 Looking to the importance of surfing in lifestyle choices, it appears to have a clear impact on  
 297 where individuals go on holiday, the car they buy and where they choose to live with 78%,  
 298 70% and 69% reporting surfing plays a ‘extremely’ or ‘very important’ role in these factors.  
 299 As with questions on self-reported wellbeing discussed above there was very little  
 300 meaningful variation across either age or gender.

301 When it comes to the factors surfers are concerned crowding at surf spots and climate  
 302 change/coastal erosion with 77% and 78% reporting they are either extremely or moderately  
 303 concerned about these issues in the future. Across all states only around a third of respondents  
 304 reported being extremely or moderately concerned about sharks.

### 305 3.3.1. Comparison of well-being impacts from surfing and running

306 To understand how the perceived benefits of surfing stacked up against those in other sports  
 307 we compared the results of the subjective impact questionnaire to a sample of runners. The  
 308 data for runners came from a cohort of 60,000 UK individuals who had participated in  
 309 *parkrun* (a weekly free 5km community race) at least once and were aged 16 years or older  
 310 (Quirk et al. 2021). Similar to our study, participants were asked to rate how taking part in  
 311 *Parkrun* has impacted various aspects of their life. Results were recorded on the same 5-point  
 312 Likert scale used in this study.

313 A comparison between the surfing and running cohorts is presented in Table 2. Firstly, across  
 314 all variables surfers reported that their sport had a greater perceived impact on their mental  
 315 and physical wellbeing than runners. Secondly, the greatest difference between the two  
 316 groups occurs in the questions asking about mental health and community connection.

317 One factor to note is that these interpretations are not meant to be casual but rather describe  
 318 potential avenues for future research. Whilst the age and lower socio-economic  
 319 characteristics were similar between the two groups, the female proportion in the *parkrun*  
 320 sample (51%) was 10% higher than in our surfers’ sample.

321 Table 4. Percentage of survey respondents reporting a “better” or “much better” result associated with their  
 322 participation in surfing or park-run

<b>Improvements from participating in surfing / park-run impacted your</b>	<b>% Surfers (n=569)</b>	<b>% Parkrun participants (n=60,000)</b>
Physical health	95	85
Amount of time spent outdoors	96	74
Sense of belonging to a community	80	70
Mental health	99	69
Ability to develop new relationships	82	57
Overall lifestyle choices (diet, reduced smoking)	N/A	52
Healthy eating	69	N/A
Reduced smoking	50	N/A
Amount of time spent with friends and family	77	N/A
Time spent with friends	N/A	41
Time spent with family	N/A	28

#### 323 4. Discussion

324 The study provides the first nation-wide analysis of recreational surfing in Australia, focusing  
 325 on surf-driven contributions to the national economy and impacts on participants (self-  
 326 reported) well-being and their lifestyle choices. The results fill a knowledge gap in our  
 327 understanding of Australia’s second most-practice water-based sport, which plays a defining  
 328 role for the livelihoods, culture and lifestyles of hundreds of communities across the country.

329 The average annual surf-related expenditure per survey respondent is \$3,770, including  
 330 regular items, new gear, services, and domestic travel. Aggregating these results across the  
 331 adult surfing population (AusPlay, 2023), the direct input into the market economy is  
 332 estimated to be \$2.56 billion per year. Accounting for retail and tourism multipliers, the  
 333 overall impact of Australia’s economy is estimated at A\$4.62 billion per year. This figure  
 334 comprises various components of surf-related expenditure, including regular items, new gear  
 335 and services, and domestic travel. We note that negative environmental impacts also exist  
 336 associated with purchases of new gear and surf-related travel, namely toxic pollutants and  
 337 greenhouse gas emissions (Serong, 2017). As the understanding of surfing demands and  
 338 impacts evolves, we suggest future studies of coastal tourisms include surfing in holistic life-  
 339 cycle assessments (Herrero et al., 2022).

340 This study also provides the first Australia-wide insights into health and well-being benefits  
 341 associated with recreational surfing. Whilst a growing body of literature documents the  
 342 positive therapeutically benefits of surfing for participants with specific conditions (Britton  
 343 et al., 2020; Caddick et al., 2015; Hignett et al., 2018), our analysis provides new information  
 344 on the effects on the general surfing population. Following approaches validated in previous  
 345 outdoor sport research (Quirk et al., 2021), we used a suite of self-reported measures of  
 346 perceived impacts.

347 Our results point to the existence of positive impacts of surfing on several aspects of physical,  
348 mental and social well-being, with over 75% of survey responses reporting “better” or “much  
349 better” outcomes associated with the practice of the sport. Whilst these results are not a  
350 clinical diagnosis, they are based self-reported measures of perceived impacts applied in  
351 similar studies of sport impact. Our results are the first for the Australian surfing population,  
352 and are consistent with previous findings pointing to the benefits of outdoor exercise and  
353 interaction with “blue spaces” (Drake et al., 2021; Murrin et al., 2023; Quirk et al., 2021).  
354 We recommend that future research examines these relationships to quantitatively understand  
355 the influence of multiple factors on positive wellbeing outcomes.

356 Our results also suggest that surfing plays an important role on community connection,  
357 including ability to form new relationships and foster current ones. Surfing has long been a  
358 core part of Australian culture with boardriders clubs playing a key role social role in many  
359 coastal communities (Lazarow & Olive, 2017; Olive & Wheaton, 2021). Across the country  
360 there are currently 215 boardriders clubs, as well as numerous community and not-for-profit  
361 organizations such as Surfrider, Save the Waves and Surfing Mums. These findings provide  
362 new insights into the impacts of surfing, adding to a rich body of literature documenting the  
363 positive impact of sporting organisations on social capital and community wellbeing (Forsell  
364 et al., 2022; Nicholson & Hoyer, 2008; Skinner et al., 2008).

365 It is important to note that recreational surfing also entails risk of injury and even death,  
366 which epidemiological studies have found are comparable to those of other outdoor and  
367 water-based activities (Lawes et al., 2023; Nathanson et al., 2002; Pikora et al., 2012). We  
368 also note the heightened risk of sun-induced skin damage due to increased time spent  
369 outdoors, which is a common concern among avid participants of water-based sports (De  
370 Castro-Maqueda et al., 2021).

371 This study also explored the relative importance of surfing in personal decisions. Our results  
372 indicate that for 78% of respondents surfing is a “very or extremely important” factor when  
373 deciding where to live. The fact that participants of nature-based sports aspire to live close  
374 to the natural features that enable those activities is consistent with utility theory and has been  
375 previously reported (Orlowski & Wicker, 2019). In this study, we provide the first set of data  
376 documenting surfers’ preferences, which we recommend are further investigated through  
377 more elaborate analysis, including hedonic pricing. To the authors’ knowledge, globally, only  
378 one study has quantified the impact of proximity to surf breaks on house prices (Scorse &  
379 Hodges, 2017), leaving an important knowledge gap in Australia.

380 In terms of concerns, respondents over 75% of respondents were “extremely or moderately”  
381 concerned about crowding at surf spots and climate change/coastal erosion. These  
382 perceptions mirror growing hazards from erosion and changes to the shoreline, which have  
383 been systematically documented across Australian beaches (Toimil et al., 2023). Despite  
384 media and popular attention towards the risks of shark interactions (Boyle & Le Busque,  
385 2022), only 27% of our survey respondents reported high levels of concern.

386 The ability to extrapolate findings from our study is limited by the non-probabilistic sampling  
387 approach. Nonetheless, we expect the publications of these first national results on the impact

388 of surfing will pave the way for future research projects aimed at filling the current  
389 knowledge gap in water-based recreational activities in Australia

## 390 5. Conclusions

391 As coastal resources come under pressure from climate change, coastal erosion and  
392 competing uses, there is an increasing need for evidence to help guide the sustainable  
393 management of these resources. Recreational surfing is one of Australia's most popular  
394 water-based sports, but its socio-economic impacts are much less understood than those of  
395 other ocean activities, such as fishing and scuba diving. Using a snowball sample of 569  
396 Australian surfers, we estimate average annual expenditure at \$A3,370 per person, with  
397 approximately 56% of that being spent on domestic tourism. Aggregating across the  
398 Australian surfing population, direct market input is \$A2.56 billion per year, while the overall  
399 impact is estimated at \$A4.62, once accounting for tourism and retail multipliers. Our results  
400 also provide the first assessments of surfing's impact on the general participating population,  
401 complementing previous studies on surf therapy under clinical settings. Over 94% of survey  
402 participants reported positive impacts of surfing on their physical health, mental health and  
403 ability to deal with stress; whilst over 75% experienced improvements in their sense of  
404 community belonging and ability to form and foster social relationships. As the first  
405 Australia-wide survey on the impact of surfing, this study calls for future research to further  
406 advance the understanding of benefits, but also negative impacts, associated with recreational  
407 surfing.
